Class BTraceUtils

java.lang.Object com.sun.btrace.BTraceUtils

public class BTraceUtils
extends java.lang.Object

This class is <u>an all-in-one wrapper for BTrace DSL methods</u>

所有功能于一身的BTrace DSL方法包装器

Author:

A. Sundararajan, Jaroslav Bachorik

Nested Class Summary

Nested Classes	
Modifier and Type	Class and Description
static class	BTraceUtils.Aggregations
static class	BTraceUtils.Atomic
static class	BTraceUtils. Collections
static class	BTraceUtils.Counters
static class	BTraceUtils.D
static class	BTraceUtils.Export
static class	BTraceUtils. Numbers
static class	BTraceUtils. <mark>Profiling</mark> Profiling support.
static class	BTraceUtils. References
static class	BTraceUtils.Reflective
static class	BTraceUtils.Speculation
static class	BTraceUtils. Strings
static class	BTraceUtils.Sys
static class	BTraceUtils. Threads Namespaced methods
static class	BTraceUtils.Time

Method Summary

All Methods	Static Methods	Concrete Methods	Deprecated Methods
Modifier and Typ	ре		Method and Description
static java	.lang.String		<pre>\$(int n) Returns n'th command line argument.</pre>
static int			<pre>\$length()</pre> Returns the number of command line arguments.
static int			accessFlags(java.lang.Class clazz) Returns the access flags of the given Class.
static int			<pre>accessFlags(java.lang.reflect.Field field) Returns the access flags of the given Field.</pre>
static int			<pre>addAndGet(java.util.concurrent.atomic.AtomicInteger ai, int delta) Atomically adds the given value to the current value.</pre>
static long			<pre>addAndGet(java.util.concurrent.atomic.AtomicLong al, long delta) Atomically adds the given value to the current value.</pre>
static <v> v</v>	void		<pre>addLast(java.util.Deque<v> queue, V value)</v></pre>
static void			<pre>addToAggregation(Aggregation aggregation, AggregationKey key, long value) Adds a value to the aggregation with a grouping key.</pre>

static void	addToAggregation(Aggregation aggregation, long value) Adds a value to the aggregation with no grouping key.
static long	availableProcessors() Returns the number of processors available to the Java virtual machine.
static java.lang.String	bootClassPath() Returns the boot class path that is used by the bootstrap class loader to search for class files.
static java.lang.Boolean	box(boolean b) Returns a Boolean instance representing the specified boolean value.
static java.lang.Byte	box(byte b) Returns a Byte instance representing the specified byte value.
static java.lang.Character	box(char c) Returns a Character instance representing the specified char value.
static java.lang.Double	box(double d) Returns a Double instance representing the specified double value.
static java.lang.Float	<pre>box(float f) Returns a Float instance representing the specified float value.</pre>
static java.lang.Integer	<pre>box(int i) Returns a Integer instance representing the specified int value.</pre>
static java.lang.Long	box(long l) Returns a Long instance representing the specified long value.
static java.lang.Short	box(short s) Returns a Short instance representing the specified short value.
static java.lang.Class	classForName(java.lang.String name) Returns Class object for given class name.
static java.lang.Class	<pre>classForName(java.lang.String name, java.lang.ClassLoader cl) Returns the Class for the given class name using the given class loader.</pre>
static java.lang.Class	<pre>classOf(java.lang.Object obj) Returns the runtime class of the given Object.</pre>
static java.lang.String	${\tt classPath()}$ Returns the Java class path that is used by the ${\tt system\ class\ loader}$ to search for class files.
static <k,v> void</k,v>	<pre>clear(java.util.Map<k,v> map)</k,v></pre>
static void	<pre>clearAggregation(Aggregation aggregation)</pre> Resets values within the aggregation to the default.
static void	<pre>commit(int id) Commits the speculative buffer associated with id.</pre>
static long	<pre>committed(java.lang.management.MemoryUsage mu) Returns the amount of memory in bytes that is committed for the Java virtual machine to use.</pre>
static boolean 指示"两个给定的对象是否相等"	<pre>compare(java.lang.Object obj1, java.lang.Object obj2) Indicates whether two given objects are "equal to" one another.</pre>
static boolean	<pre>compareAndSet(java.util.concurrent.atomic.AtomicInteger ai, int expect, int update) Atomically sets the value of given AtomitInteger to the given updated value if the current value == the expected value.</pre>
static boolean	<pre>compareAndSet(java.util.concurrent.atomic.AtomicLong al, long expect, long update) Atomically sets the value to the given updated value if the current value == the expected value.</pre>
static int	<pre>compareTo(java.lang.String str1, java.lang.String str2) Compares two strings lexicographically.</pre>
static int	<pre>compareToIgnoreCase(java.lang.String str1, java.lang.String str2) Compares two strings lexicographically, ignoring case differences.</pre>
static java.lang.String	concat (java.lang.String str1, java.lang.String str2) Concatenates the specified strings together. 将"指定的字符串"连接在一起

static void dumpHeap(java.lang.String fileName) 格式的文件 Dump the snapshot of the Java heap to a file in hprof binary format. static void dumpHeap(java.lang.String fileName, boolean live) Dump the snapshot of the Java heap to a file in hprof binary format. static boolean endsWith(java.lang.String s, java.lang.String end) exit() This is same as exit(int) except that the exit code is zero.		
testic of, No boolean containancy java.util Narw, No any java.lang.object key) static of, No boolean containancy interface of the containance of	static <e> boolean</e>	<pre>contains(java.util.Collection<e> coll, java.lang.Object obj)</e></pre>

Returns a Field object that reflects the specified declared field of the class or interface represented by the given Class object. static java.lang.reflect.Field field(java.lang.Class clazz, java.lang.String name,	static double	-
	static java.lang.reflect. <mark>Field</mark>	Returns a Field object that reflects the specified declared field of the class or
	static java.lang.reflect.Field	

	Returns a Field object that reflects the specified declared field of the class or interface represented by the given Class object.
static java.lang.reflect.Field	<pre>field(java.lang.String clazz, java.lang.String name) Returns a Field object that reflects the specified declared field of the class or interface represented by the given Class object.</pre>
static java.lang.reflect.Field	<pre>field(java.lang.String clazz, java.lang.String name, boolean throwException) Returns a Field object that reflects the specified declared field of the class or interface represented by the given Class object.</pre>
static long	$\label{thm:cont} \textbf{finalizationCount} (\)$ Returns the approximate number of objects for which finalization is pending.
static long	freeMemory() 返回"JVM中的空闲内存大小" <u>Returns</u> the amount of free memory in the Java Virtual Machine.
static void	gc() Runs the garbage collector.
static int	<pre>get(java.util.concurrent.atomic.AtomicInteger ai) Gets the current value of the given AtomicInteger.</pre>
static long	<pre>get(java.util.concurrent.atomic.AtomicLong al)</pre> Gets the current value the given AtomicLong.
static java.lang.Object	<pre>get(java.lang.reflect.Field field) Gets the value of a static reference field.</pre>
static java.lang.Object	<pre>get(java.lang.reflect.Field field, java.lang.Object obj) Gets the value of an instance reference field.</pre>
static <k,v> V</k,v>	<pre>get(java.util.Map<k,v> map, java.lang.Object key)</k,v></pre>
static int	<pre>getAndAdd(java.util.concurrent.atomic.AtomicInteger ai, int delta) Atomically adds the given value to the current value.</pre>
static long	<pre>getAndAdd(java.util.concurrent.atomic.AtomicLong al, long delta) Atomically adds the given value to the current value.</pre>
static int	<pre>getAndDecrement(java.util.concurrent.atomic.AtomicInteger ai) Atomically decrements by one the current value of given AtomicInteger.</pre>
static long	<pre>getAndDecrement(java.util.concurrent.atomic.AtomicLong al) Atomically decrements by one the current value.</pre>
static int	<pre>getAndIncrement(java.util.concurrent.atomic.AtomicInteger ai) Atomically increments by one the current value of given AtomicInteger.</pre>
static long	<pre>getAndIncrement(java.util.concurrent.atomic.AtomicLong al) Atomically increments by one the current value.</pre>
static int	<pre>getAndSet(java.util.concurrent.atomic.AtomicInteger ai, int newValue) Atomically sets to the given value and returns the old value.</pre>
static long	<pre>getAndSet(java.util.concurrent.atomic.AtomicLong al, long newValue) Atomically sets to the given value and returns the old value.</pre>
static boolean	<pre>getBoolean(java.lang.reflect.Field field) Gets the value of a static boolean field.</pre>
static boolean	<pre>getBoolean(java.lang.reflect.Field field, java.lang.Object obj) Gets the value of an instance boolean field.</pre>
static byte	<pre>getByte(java.lang.reflect.Field field) Gets the value of a static byte field.</pre>
static byte	<pre>getByte(java.lang.reflect.Field field, java.lang.Object obj) Gets the value of an instance byte field.</pre>
static char	<pre>getChar(java.lang.reflect.Field field) Gets the value of a static char field.</pre>
static char	<pre>getChar(java.lang.reflect.Field field, java.lang.Object obj) Gets the value of an instance char field.</pre>

static java.lang.Class	<pre>getComponentType(java.lang.Class clazz) returns component type of an array Class.</pre>
static double	<pre>getDouble(java.lang.reflect.Field field) Gets the value of a static double field.</pre>
static double	<pre>getDouble(java.lang.reflect.Field field, java.lang.Object obj) Gets the value of an instance double field.</pre>
static java.util.Map <java.lang.string,java.lang.string></java.lang.string,java.lang.string>	getenv() 返回"当前系统环境的一个不可修改的映射表视图" <u>Returns</u> an unmodifiable string map view of the current system environment.
static java.lang.String	<pre>getenv(java.lang.String name)</pre> Gets the value of the specified environment variable.
static float	getFloat(java.lang.reflect.Field field) Gets the value of a static float field.
static float	<pre>getFloat(java.lang.reflect.Field field, java.lang.Object obj) Gets the value of an instance float field.</pre>
static int	<pre>getInt(java.lang.reflect.Field field) Gets the value of a static int field.</pre>
static int	<pre>getInt(java.lang.reflect.Field field, java.lang.Object obj) Gets the value of an instance int field.</pre>
static long	<pre>getLong(java.lang.reflect.Field field) Gets the value of a static long field.</pre>
static long	<pre>getLong(java.lang.reflect.Field field, java.lang.Object obj) Gets the value of an instance long field.</pre>
static int	getpid() <u>Returns</u> the process id of the currently BTrace'd process.
static short	<pre>getShort(java.lang.reflect.Field field) Gets the value of a static short field.</pre>
static short	<pre>getShort(java.lang.reflect.Field field, java.lang.Object obj) Gets the value of an instance short field.</pre>
static java.lang.Class	getSuperclass (java.lang.Class clazz) Returns the Class representing the superclass of the entity (class, interface, primitive type or void) represented by the given Class.
static long	getTotalGcTime() 返回"垃圾回收所消耗的总时长" <u>Returns</u> the total amount of time spent in GarbageCollection up to this point since the application was started.
static int	hash(java.lang.Object obj) Returns a hash code value for the object.
static java.lang.management.MemoryUsage	heapUsage() 返回"堆内存的使用情况" Returns heap memory usage
static boolean	holdsLock(java.lang.Object obj) <u>Returns true if and only if</u> the current thread holds the monitor lock on the specified object.
static int	<pre>identityHashCode(java.lang.Object obj) Returns the same hash code for the given object as would be returned by the default method hashCode(), whether or not the given object's class overrides hashCode().</pre>
static java.lang.String	<pre>identityStr(java.lang.Object obj) Returns identity string of the form class-name@identity-hash</pre>
static int	<pre>incrementAndGet(java.util.concurrent.atomic.AtomicInteger ai) Atomically increments by one the current value of given AtomicInteger.</pre>
static long	<pre>incrementAndGet(java.util.concurrent.atomic.AtomicLong al) Atomically increments by one the current value.</pre>
static int	<pre>indexOf(java.lang.String str1, java.lang.String str2)</pre>
static long	<pre>init(java.lang.management.MemoryUsage mu) Returns the amount of memory in bytes that the Java virtual machine initially requests from the operating system for memory management.</pre>
static boolean	isArray(java.lang.Class clazz) Determines if the given Class object represents an array class.

static boolean	<pre>isAssignableFrom(java.lang.Class<?> a, java.lang.Class<?> b) Determines if the class or interface represented by the first Class object is either the same as, or is a superclass or superinterface of, the class or interface represented by the second Class parameter.</pre>
static boolean	isBootClassPathSupported() Tests if the Java virtual machine supports the boot class path mechanism used by the bootstrap class loader to search for class files.
static <e> boolean</e>	<pre>isEmpty(java.util.Collection<e> coll)</e></pre>
static <k,v> boolean</k,v>	<pre>isEmpty(java.util.Map<k,v> map)</k,v></pre>
static boolean	<pre>isInfinite(double d) Returns true if the specified number is infinitely large in magnitude, false otherwise.</pre>
static boolean	<pre>isInfinite(float f) Returns true if the specified number is infinitely large in magnitude, false otherwise.</pre>
static boolean	<pre>isInstance(java.lang.Class clazz, java.lang.Object obj) Determines if the specified Object is assignment-compatible with the object represented by the specified Class.</pre>
static boolean	<pre>isInterface(java.lang.Class clazz) Determines if the specified Class object represents an interface type.</pre>
static boolean	<pre>isInteruppted()</pre> Tests whether this thread has been interrupted.
static boolean	<pre>isNaN(double d) Returns true if the specified number is a Not-a-Number (NaN) value, false otherwise.</pre>
static boolean	<pre>isNaN(float f) Returns true if the specified number is a Not-a-Number (NaN) value, false otherwise.</pre>
static boolean	<pre>isPrimitive(java.lang.Class clazz) Returns whether the given Class represent primitive type or not.</pre>
static void	<mark>jstack</mark> () 打印"当前线程的Java调用栈信息" <u>Prints</u> <mark>the java stack trace of the current thread</mark> .
static void	<pre>jstack(int numFrames) Prints the java stack trace of the current thread.</pre>
static void	<mark>jstack</mark> (java.lang.Throwable exception) 打印"给定异常对象的 <u>Prints</u> the stack trace of the given exception object." 调用栈信息"
static void	<pre>jstack(java.lang.Throwable exception, int numFrames) Prints the stack trace of the given exception object.</pre>
static void	<mark>'jstackAll</mark> () 打印"所有Java线程的调用栈信息" <u>Prints</u> <mark>Java stack traces of all the Java threads</mark> .
static void	<pre>jstackAll(int numFrames) Prints Java stack traces of all the Java threads.</pre>
static java.lang.String	jstackAllstr() Returns the stack traces of all Java threads as a String.
static java.lang.String	<pre>jstackAllstr(int numFrames)</pre> Returns atmost given number of frames in stack traces of all threads as a String.
static java.lang.String	jstackStr() Returns the stack trace of current thread <u>as a String</u> .
static java.lang.String	<pre>jstackStr(int numFrames) Returns the stack trace of the current thread as a String but includes atmost the given number of frames.</pre>
static java.lang.String	<pre>jstackStr(java.lang.Throwable exception) Returns the stack trace of given exception object as a String.</pre>
static java.lang.String	<pre>jstackStr(java.lang.Throwable exception, int numFrames)</pre> Returns stack trace of given exception object as a String.
static int	<pre>lastIndexOf(java.lang.String str1, java.lang.String str2)</pre>

static void	<pre>lazySet(java.util.concurrent.atomic.AtomicInteger ai, int newValue) Eventually sets to the given value to the given AtomicInteger.</pre>
static void	<pre>lazySet(java.util.concurrent.atomic.AtomicLong al, long newValue)</pre>
	Eventually sets to the given value to the given AtomicLong.
static int	length(java.lang.String str) Returns the length of the given string.
static java.lang.String	libraryPath() Returns the Java library path.
static java.lang. <mark>ClassLoader</mark>	loader (java.lang.Class clazz) Returns the class loader for the given class.
static double	log(double a) Returns the natural logarithm (base e) of a double value.
static double	log10 (double a) Returns the base 10 logarithm of a double value.
static boolean	<pre>matches(java.util.regex.Pattern regex, java.lang.String input) Matches the given (precompiled) regular expression and attempts to match the given input against it.</pre>
static boolean	<pre>matches(java.lang.String regex, java.lang.String input) Compiles the given regular expression and attempts to match the given input against it.</pre>
static long	<pre>max(java.lang.management.MemoryUsage mu) Returns the maximum amount of memory in bytes that can be used for memory management.</pre>
static long	maxMemory() 返回"JVM可使用的最大内存容量" <u>Returns</u> the maximum amount of memory that the Java virtual machine will attempt to use.
static java.lang.String	name(java.lang.Class clazz) 返回"给定类对象的名称" Returns the name of the given Class object.
static java.lang.String	<pre>name(java.lang.reflect.Field field) Returns the name of the Field object.</pre>
static java.lang.String	name(java.lang.Thread thread) <u>Returns</u> the name of the given thread. <u>Executive</u> Executive Executive Exec
static Aggregation	newAggregation(AggregationFunction type) Creates a new aggregation based on the given aggregation function type.
static AggregationKey	<pre>newAggregationKey(java.lang.Object element1)</pre> Creates a grouping aggregation key with the provided value.
static AggregationKey	<pre>newAggregationKey(java.lang.Object element1, java.lang.Object element2) Creates a composite grouping aggregation key with the provided values.</pre>
static AggregationKey	<pre>newAggregationKey(java.lang.Object element1, java.lang.Object element2, java.lang.Object element3)</pre> Creates a composite grouping aggregation key with the provided values.
static AggregationKey	newAggregationKey(java.lang.Object element1, java.lang.Object element2, java.lang.Object element3, java.lang.Object element4) Creates a composite grouping aggregation key with the provided values.
static java.util.concurrent.atomic.AtomicInteger	newAtomicInteger(int initialValue) Creates a new AtomicInteger with the given initial value.
static java.util.concurrent.atomic.AtomicLong	newAtomicLong(long initialValue) Creates a new AtomicLong with the given initial value.
static <v> java.util.Deque<v></v></v>	newDeque()
static <k,v> java.util.Map<k,v></k,v></k,v>	new <mark>HashMap</mark> () Operating on maps
static <k,v> java.util.Map<k,v></k,v></k,v>	newWeakMap()
static java.lang.management.MemoryUsage	non <mark>HeapUsage</mark> () 返回"非堆内存的使用情况" <u>Returns</u> <mark>non-heap memory usage</mark>

static java.lang.ClassLoader	<pre>parentLoader(java.lang.ClassLoader loader) Returns the parent class loader of the given loader.</pre>
static boolean	<pre>parseBoolean(java.lang.String s) Parses the string argument as a boolean.</pre>
static byte	<pre>parseByte(java.lang.String s) Parses the string argument as a signed decimal byte.</pre>
static double	<pre>parseDouble(java.lang.String s) Returns a new double initialized to the value represented by the specified String, as performed by the valueOf method of class Double.</pre>
static float	<pre>parseFloat(java.lang.String s) Returns a new float initialized to the value represented by the specified String, as performed by the valueOf method of class Float.</pre>
static int	<pre>parseInt(java.lang.String s) Parses the string argument as a signed decimal integer.</pre>
static long	<pre>parseLong(java.lang.String s) Parses the string argument as a signed decimal long.</pre>
static short	<pre>parseShort(java.lang.String s) Parses the string argument as a signed decimal short.</pre>
static java.util.regex.Pattern	<pre>pattern(java.lang.String regex)</pre> This is synonym for "regexp".
static java.util.regex.Pattern	<pre>pattern(java.lang.String regex, int flags) This is synonym for "regexp".</pre>
static long	peakThreadCount() <u>Returns</u> the peak live thread count <u>since the Java virtual machine started</u> or peak was reset.
static <v> V</v>	<pre>peek(java.util.Deque<v> queue)</v></pre>
static <v> V</v>	<pre>peekFirst(java.util.Deque<v> queue)</v></pre>
static <v> V</v>	<pre>peekLast(java.util.Deque<v> queue)</v></pre>
static long	<pre>perfInt(java.lang.String name) accessing jvmstat (perf) int counter</pre>
static long	<pre>perfLong(java.lang.String name) accessingjymstat (perf) long counter</pre>
static java.lang.String	<pre>perfString(java.lang.String name) accessing jymstat (perf) String counter</pre>
static <v> V</v>	<pre>poll(java.util.Deque<v> queue)</v></pre>
static void	<pre>print(boolean b) Prints a boolean value.</pre>
static void	<pre>print(char c) Prints a character.</pre>
static void	<pre>print(double d) Prints a double-precision floating-point number.</pre>
static void	<pre>print(float f) Prints a floating-point number.</pre>
static void	<pre>print(int i) Prints an integer.</pre>
static void	<pre>Print(long 1) Prints a long integer.</pre>
static void	<pre>print(java.lang.Object obj)</pre>
static void	<pre>printAggregation(java.lang.String name, Aggregation aggregation) Prints the aggregation.</pre>
static void	<pre>printAggregation(java.lang.String name, Aggregation aggregation, java.lang.String format) Prints aggregation using the provided format</pre>
static void	<pre>printArray(java.lang.Object[] array)</pre> Prints the elements of the given array as comma separated line bounded by '[' and

	T.
static void	<pre>printEnv() Prints all system environment values.</pre>
static void	<pre>printFields(java.lang.Object obj)</pre> Print all instance fields of an object as name-value pairs.
static void	<pre>printFields(java.lang.Object obj, boolean classNamePrefix) Print all instance fields of an object as name-value pairs.</pre>
static void	<pre>println()</pre> Terminates the current line by writing the line separator string.
static void	<pre>println(boolean b)</pre> Prints a boolean and then terminate the line.
static void	println(char c) Prints a character and then terminate the line.
static void	<pre>println(double d) Prints a double and then terminate the line.</pre>
static void	<pre>println(float f) Prints a float and then terminate the line.</pre>
static void	<pre>println(int i) Prints an integer and then terminate the line.</pre>
static void	println(long 1) Prints a long and then terminate the line.
static void	println(java.lang.Object obj) Prints the given object and then prints a newline
static void	printMap(java.util.Map map) Prints the given Map.
static void	<pre>printNumber(java.lang.String name, java.lang.Number value) Prints a number.</pre>
static void	<pre>printNumberMap(java.lang.String name, java.util.Map<java.lang.string,? extends="" java.lang.number=""> data) Prints the given Map.</java.lang.string,?></pre>
static void	printProperties() Prints all Sys properties.
static void	<pre>printStaticFields(java.lang.Class clazz) Print all static fields of the class as name-value pairs.</pre>
static void	<pre>printStaticFields(java.lang.Class clazz, boolean classNamePrefix) Print all static fields of the class as name-value pairs.</pre>
static void	<pre>printStringMap(java.lang.String name, java.util.Map<java.lang.string,java.lang.string> data) Prints the given Map.</java.lang.string,java.lang.string></pre>
static void	printVmArguments() Prints VM input arguments list.
static java.lang.Class	probeClass() Deprecated. Since 1.1. Use ProbeClassName and Self annotations instead
static int	<pre>probeLine()</pre> Returns the currently probed source line number (if available).
static java.lang.String	probeMethod() Deprecated. Since 1.1. Use ProbeMethodName annotation instead
static java.util.Properties	properties() Returns all Sys properties.
static java.lang.String	<pre>property(java.lang.String key)</pre> Gets the system property indicated by the specified key.
static <v> void</v>	<pre>push(java.util.Deque<v> queue, V value)</v></pre>

static <k,v> V</k,v>	<pre>put(java.util.Map<k,v> map, K key, V value)</k,v></pre>
static double	<pre>random() Returns a double value with a positive sign, greater than or equal to 0.0 and less than 1.0.</pre>
static java.util.regex.Pattern	<pre>regexp(java.lang.String regex) Compiles the given regular expression into a pattern.</pre>
static java.util.regex.Pattern	<pre>regexp(java.lang.String regex, int flags) Compiles the given regular expression into a pattern with the given flags.</pre>
static <k,v> V</k,v>	<pre>remove(java.util.Map<k,v> map, java.lang.Object key)</k,v></pre>
static <v> V</v>	<pre>removeFirst(java.util.Deque<v> queue)</v></pre>
static <v> V</v>	<pre>removeLast(java.util.Deque<v> queue)</v></pre>
static void	runFinalization() Runs the finalization methods of any objects pending finalization.
static void	<pre>serialize(java.io.Serializable obj, java.lang.String fileName)</pre> Serialize a given object into the given file.
static void	<pre>set(java.util.concurrent.atomic.AtomicInteger ai, int newValue) Sets to the given value to the given AtomicInteger.</pre>
static void	<pre>set(java.util.concurrent.atomic.AtomicLong al, long newValue) Sets to the given value.</pre>
static <e> int</e>	<pre>size(java.util.Collection<e> coll)</e></pre>
static <k,v> int</k,v>	<pre>size(java.util.Map<k,v> map)</k,v></pre>
static long	<pre>sizeof(java.lang.Object objectToSize) Returns an implementation-specific approximation of the amount of storage consumed by the specified object.</pre>
static java.lang.ref. <mark>SoftReference</mark>	<pre>softRef(java.lang.Object obj) Creates and returns a soft reference to the given object.</pre>
static void	<pre>speculate(int id) Sets current speculative buffer id.</pre>
static int	speculation() Returns an identifier for a new speculative buffer.
static boolean	<pre>startsWith(java.lang.String s, java.lang.String start)</pre>
static java.lang.String	<pre>str(boolean b) Returns a String object representing the specified boolean.</pre>
static java.lang.String	<pre>str(char c) Returns a String object representing the specified char.</pre>
static java.lang.String	<pre>str(double d) Returns a string representation of the double argument.</pre>
static java.lang.String	<pre>str(float f) Returns a string representation of the float argument.</pre>
static java.lang.String	<pre>str(int i) Returns a String object representing the specified integer.</pre>
static java.lang.String	<pre>str(long 1) Returns a String object representing the specified long.</pre>
static java.lang.String	<pre>str(java.lang.Object obj) Returns a string representation of the object.</pre>
static java.lang.String	<pre>strcat(java.lang.String str1, java.lang.String str2) This is synonym to "concat".</pre>
static int	<pre>strcmp(java.lang.String str1, java.lang.String str2) This is synonym to "compareTo" method.</pre>
static int	<pre>stricmp(java.lang.String str1, java.lang.String str2) This is synonym to "compareToIgnoreCase".</pre>
static int	<pre>strlen(java.lang.String str) This is synonym for "length".</pre>
static int	<pre>strstr(java.lang.String str1, java.lang.String str2) Find String within String</pre>

static java.util.List <java.lang.string></java.lang.string>	<pre>vmArguments() <u>Returns</u> the input arguments passed to the Java virtual machine which does not include the arguments to the main method.</pre>
static long	vmStartTime() Returns the start time of the Java virtual machine in milliseconds.
static long	<pre>vmUptime()</pre> Returns the uptime of the Java virtual machine in milliseconds.
static java.lang.String	vmVersion() Returns the Java virtual machine implementation version.
static boolean	<pre>weakCompareAndSet(java.util.concurrent.atomic.AtomicInteger ai, int expect, int update) Atomically sets the value to the given updated value if the current value == the expected value.</pre>
static boolean	<pre>weakCompareAndSet(java.util.concurrent.atomic.AtomicLong al, long expect, long update) Atomically sets the value to the given updated value if the current value == the expected value.</pre>
static java.lang.ref.WeakReference	<pre>weakRef(java.lang.Object obj) Creates and returns a weak reference to the given object.</pre>
static void	<pre>writeDOT(java.lang.Object obj, java.lang.String fileName) Writes a .dot document to persist the tree of the all the transitively reachable objects from the given "root" object.</pre>
static void	<pre>writeXML(java.lang.Object obj, java.lang.String fileName) Writes an XML document to persist the tree of the all the transitively reachable objects from the given "root" object.</pre>

Methods inherited from class java.lang.Object

clone, equals, finalize, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

Method Detail

isInteruppted

public static boolean isInteruppted()

 $Tests whether this thread has been interrupted. The {\it interrupted status} of the thread is unaffected by this method.$

A thread interruption ignored because a thread was not alive at the time of the interrupt will be reflected by this method returning false.

Returns:

true if this thread has been interrupted; false otherwise.

jstack

public static void jstack()

Prints the java stack trace of the current thread.

jstack

public static void jstack(int numFrames)

Prints the java stack trace of the current thread. But, atmost given number of frames.

Parameters:

numFrames - number of frames to be printed. When this is negative all frames are printed.

12

jstackAll

public static void jstackAll()

Prints Java stack traces of all the Java threads.

jstackAll

public static void jstackAll(int numFrames)
